Dipole alignment of bound states
Bound events: N = 0
colours: blue CREM, vermillion theory
vermillion dashed: para/ortho threshold at +0.5
para (≥0.5) : ortho = 0 : 0
isotropic expectation 1 : 3
median drift within an event = nan
Orientation is set at capture: this classical
model has no spin-relaxation channel, so the
label reflects the initial random orientation.
