Explicit categorical-outcome censoring model

logit P(classified) = $\beta_0 + \beta_E z(K_{CM}) + \beta_b z(b)$

separate failure logit; standardized slopes use L2 penalty $\chi=1$

observed / administrative censoring / failure = 1000 / 0 / 0

not classified constant rate 0; slopes not estimable

NumericalFailure constant rate 0; slopes not estimable

IPCW floor=0.05, min pi=1, max weight=1, effective N=1000

IPCW: Hajek-normalized physical classes; sensitivity estimate only

assumption: outcome MAR conditional on sampled (K_{CM},b) + positivity

NumericalFailure is missing outcome, not a physical event or censoring time
